ARCHITECTURE AND DEPLOYMENT

Simple to run. Yours to host.

React console + Go API + PostgreSQL. Optional native desktop launchers wrap the same stack for local evaluation.

Runtime pieces

Console	React 19 + Vite SPA. Desktop / install builds serve it same-origin from the API (`UI_DIR`).
API	Go (chi, pgx). Feature catalogue, batch/lab/QA modules, market stubs, append-only audit.
Database	PostgreSQL with SQL migrations. Default local DSN uses database `zyvor_pharma`.
Desktop	`pharma-desktop` / PharmaQMS.app / PharmaQMS.exe — start Postgres if needed, run API+UI, open the browser.

Deploy paths

Desktop

`make desktop` · `make desktop-macos` · `make desktop-windows`. Best for an afternoon try.

Compose

Podman/Docker Compose for Postgres + services on Mac / Linux / WSL.

FluxVM

macOS FluxVM / lima path for a contained plant-like stack.

k3s

Helm-oriented install for a small cluster pilot.

Install bundle (public site releases)

Published assets: `get.sh`, `get.ps1`, `pharma-qms-install.tar.gz`, `SHA256SUMS`. Built from the private product tree via `make package-install`. No application source on the marketing repo.

Default local endpoints

Health	`http://127.0.0.1:8080/healthz`
API + UI	`http://127.0.0.1:8080/` (desktop / install)
Dev split	API :8080 · Vite UI :5173

Pilot only. Architecture choices favour evaluability, not a validated GxP hosting claim.
