IT AND SECURITY QUESTIONS

Straight answers for your team.

Where does data live?	On infrastructure you operate — PostgreSQL behind the Go API. Desktop home under `~/.zyvor-pharma-qms` for local binaries.
Cloud required?	No. Compose, FluxVM, k3s, or native desktop. SaaS is not the default story.
SSO / OIDC?	Not the primary pilot surface yet. Desktop uses a role actor selector for synthetic walkthroughs.
Is traffic encrypted?	You terminate TLS at your reverse proxy / ingress. Localhost desktop demos often use HTTP on loopback only.
Multi-tenant?	Single-plant pilot orientation. Not a multi-tenant SaaS control plane.
Backups?	Your Postgres backup policy. The product does not ship a managed backup service.
Pen tested?	No independent pen-test report published yet.
Source code?	Private product repository. Public site is marketing + install scripts only.
Part 11?	No. Not validated. Customer owns validation if they move beyond synthetic pilots.
Dependencies?	Go API, React console, PostgreSQL, optional Podman/Docker for local Postgres.
Windows?	Yes — PharmaQMS.exe / PowerShell installer / WSL compose path.
macOS?	Yes — PharmaQMS.app and CLI desktop launcher.
Updates?	Via product releases you choose to deploy; public get.sh verifies SHA-256 of the install tarball.
Logging?	API logs + hash-chained application audit events (verify endpoint). Wire to your SIEM as you prefer.

Still unsure? Email **security@zyvor.dev** or **sales@zyvor.dev**. Please do not file public GitHub issues with sensitive infrastructure detail.
